4 A combination CPR device supports a supine victim on a
5 movable platform that carries an external heart massager. The
6 platform moves in the cephalo-caudal direction with the external
7 heart massager above the sternum. The external heart massager
8 moves in the anterior-posterior direction. The movement of the
9 platform and the external heart massager is conducted
10 simultaneously and may be coordinated manually or by a
11 controller.
